Website online ordering

Your restaurant's website is your online business card, the most important thing next to your physical location. To enjoy its benefits to the fullest and increase your profits in the process, all you need to do is add an Order button on your homepage.

Installing our ordering widget on your website is pain-free and literally free. It will display a "See MENU & Order" button that customers can click to browse your menu and place an order.

They can customize their meal with choices, toppings, and addons, choose from a variety of payment options, select delivery or pickup, all from the one-page order checkout.

Facebook online ordering

If you have a Facebook page, we're pretty sure your followers, aka your restaurant's loyal customers, are showering you with Likes and comments on your mouth-watering posts.

How about being showered with online orders as well?

GloriaFood helps you monetize your social media presence and provide customers with an easy way to order food directly from their favorite social media platform.

Copy the Facebook smart link we provide in your admin dashboard onto Facebook's "Start Order" button, and you'll bring Facebook ordering to your page in just a few clicks.

When clicked, the button will automatically open your ordering menu for customers to browse. A seamless transition from your Facebook page to your online menu with no extra clicks.

Easy order taking on your smartphone or tablet

GloriaFood wants to help small and medium restaurant owners all over the world capitalize on their online presence by accepting food orders without breaking the bank.

That's why we found a way to turn your smartphone or tablet into an order-taking machine with our free iOS and Android app. No need to purchase expensive equipment to start accepting orders today.

Every time a customer places an order on your website or Facebook page, you will get an audio and visual notification on your smartphone/tablet.

Upon clicking on the pending order, you will see all the customer and order details you need, as well as an estimated delivery time for delivery orders (actual drive time and distance).

You then fill in the estimated pickup or delivery time that gets sent to the food client, click Accept, and start cooking. Your customer receives the confirmation in real-time in the ordering widget, as well as in an email containing all the details of the order.
